Template Manual

Morphisec HTML

Thank You :)

Thanks for purchasing template and for supporting our work. Morphisec is our new fancy template. Responsive, clean and professional look with sleek design will satisfy all your needs.

You will need basic HTML, CSS, Javascript skills to edit Morphisec HTML.

We will try to help you out with this documentation. If we fail here, you can always contact us and our developers will try to solve your issue.

How To Install?

Considering that Morphisec is HTML template, all you need to do is to upload all template files via your FTP account to your web server (for uploading files you can use FTP client like **FileZilla**)

These are parameters that you need to modify:

Folder Structure

TEMPLATE

```
|  
  
|--- assets  
  
| |--- images  
| |--- all demo images  
  
| |--- css  
| |--- all css files (style.css, responsive.css)  
  
| |--- fonts  
| |--- main font files  
  
| |--- js  
| |--- main.js  
  
|  
  
|--- index.html  
  
|
```

General HTML structure

Each .html file has **head** tag which looks like this:

```
<head>
  <meta charset="UTF-8" />
  <meta http-equiv="X-UA-Compatible" content="IE=edge" />
  <meta name="viewport" content="width=device-width, initial-scale=1.0" />
  <meta name="description" content="Template by Vektora" />
  <meta name="keywords" content="HTML, CSS, Javascript" />
  <meta name="author" content="Vektora" />
  <meta name="robots" content="noindex" />
  <title>Morphisec</title>
  <link rel="shortcut icon" href="assets/images/M.png" type="image/x-icon" />

  <!-- fonts -->
  <link rel="preconnect" href="https://fonts.googleapis.com">
  <link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>
  <link
href="https://fonts.googleapis.com/css2?family=Poppins:wght@300;400;500;600;700;800&dis
lay=swap" rel="stylesheet">

  <!-- css -->
  <link rel="stylesheet" href="assets/css/style.css" />
  <link rel="stylesheet" href="assets/css/responsive.css">

  <!-- Icon -->
  <script src="https://code.iconify.design/2/2.1.0/iconify.min.js"></script>

  <!-- aos -->
  <link rel="stylesheet" href="https://unpkg.com/aos@next/dist/aos.css" />

</head>
```

Here you need to set your own **title**, **description**, **keywords** and **author**. Also, don't forget to create your own **favicon** and to replace the default one (it is placed in the **images** folder). If you need to change/add Google fonts, you need edit this line:

```
<!-- fonts -->
  <link
href="https://fonts.googleapis.com/css2?family=Poppins:wght@300;400;500;600;700;800&dis
lay=swap" rel="stylesheet">
```

Also, each .html file consist the **header** part and here will find code for the menu:

```
<ul class="nav-menu" data-aos="fade-left">
  <li><a href="#optimize" class="nav-link">Product</a></li>
  <li><a href="#drill" class="nav-link">Solutions</a></li>
  <li><a href="#defend" class="nav-link">Company</a></li>
  <li><a href="#protect" class="nav-link">Customers</a></li>
  <li><a href="#wh" class="nav-link">Resources</a></li>
  <a href="#" class="btn btn-secondary">Try For Free</a>
</ul>
```

As you see, each link in the menu start with "# "-this is because Morphisec has sections (Optimize, Drill, Defend ...) which are the part of one big page, and with code like that (**href="#optimize"**) we have a smooth scroll inside the big one page.

And the last part which is the same for all .html files is a **footer**.

Inside the footer tag there is some content (mail, social icons, etc...) which is the same on all pages and just below that, there is a part of the code where we are including all **JS** files which we are using in our template. This part looks like this:

```
<!-- javascript -->
<script src="assets/js/main.js"></script>
<script src="https://unpkg.com/aos@2.3.1/dist/aos.js"></script>
<script>
  AOS.init();
</script>
```

Front Page index.html

On **index.html** page are placed 7 sections. Each section is separated and start with code like this:

```
<!-- Optimize -->
<section class="section optimize" id="optimize">

    ...

</section>
```

Also, for each of this sections you will find in main **style.css** file appropriate css code, like this (example for Counters section):

```
/* =====
   Counters
   ===== */

.counter-data-wrap {
  display: flex;
  flex-wrap: wrap;
  justify-content: center;
  gap: 70px ;
}

.counter-box {
  display: flex;
  align-items: center;
}

.icon-box {
  background-color: var(--brand-secondary);
  width: 64px;
  height: 64px;
  border-radius: 50%;
  display: flex;
  align-items: center;
  justify-content: center;
  margin-right: 20px;
}
```

CSS Structure

In **css** folder are placed all css files include the main **style.css**

Basically, you don't need to change any of this css files which are placed in **css** folder - the only css file which may you need to change (if you need it at all) is **style.css** file.

In **style.css** file you will find code for each section and also for other parts like global styles, typography, button etc... and each of this part is start with code (comment code) like this:

```
/* =====  
   Counters  
===== */
```

So you will easy find css code for each part.

JS Structure

In **js** folder are placed all js files.

There is **main.js** - this is our custom file

In this file you will find the code for setting up the navbar scroll, link active, responsive etc....

If you need to change some part here, in **JS** code, you will need to have some **JS** skills to do that. If you have trouble, please use our support forum to contact us and we will try to help you.

Source & Credits

Special thanks to creators and contributors of these awesome libraries, we couldn't have done this without them.
